Our Solar System

Before you read

- How many planets do you know in our solar system?

Our solar system has eight planets that orbit the Sun. The closest planet to the Sun is Mercury, and the farthest is Neptune. Each planet has a different surface, atmosphere, and temperature.

Earth is special because it has an atmosphere that we can breathe and a perfect distance from the Sun, which keeps the temperature comfortable for life. Astronauts who travel to other planets have to wear special suits, because those planets don't have a breathable atmosphere.

The Moon is Earth's only natural satellite. It doesn't have its own light — it simply reflects light from the Sun. Many other planets in our solar system, like Jupiter and Saturn, have several moons.

1. Which planet is closest to the Sun?

- a. Earth
- b. Mercury
- c. Neptune
- d. Mars

2. The Moon is Earth's only natural _____.

3. Astronauts don't have to wear special suits on other planets. — *True / False*

After you read

- Which planet would you like to visit, and why?
